

SUBSTITUTED SULFONYLPHENYLHETEROCYCLES
AS CYCLOOXYGENASE-2 AND 5-LIPOXYGENASE
INHIBITORS

5 FIELD OF THE INVENTION

This invention is in the field of antiinflammatory pharmaceutical agents and specifically relates to compounds, compositions and methods for treating
10 disorders mediated by cyclooxygenase-2 or 5-lipoxygenase, such as inflammation and allergic conditions such as asthma.

BACKGROUND OF THE INVENTION

15

Prostaglandins play a major role in the inflammation process, and the inhibition of prostaglandin production, especially production of PGG₂, PGH₂ and PGE₂, has been a common target of
20 antiinflammatory drug discovery. However, common non-steroidal antiinflammatory drugs (NSAIDs) that are active in reducing the prostaglandin-induced pain and swelling associated with the inflammation process are also active in affecting other prostaglandin-regulated
25 processes not associated with the inflammation process. Thus, use of high doses of most common NSAIDs can produce severe side effects, including life threatening ulcers, that limit their therapeutic potential. An
30 alternative to NSAIDs is the use of corticosteroids, which have even more drastic side effects, especially when long term therapy is involved.

Previous NSAIDs have been found to prevent the production of prostaglandins by inhibiting enzymes in the human arachidonic acid/prostaglandin pathway
35 including the enzyme cyclooxygenase (COX). The recent discovery of an inducible enzyme associated with inflammation (named "cyclooxygenase-2 (COX-2)" or "prostaglandin G/H synthase II") provides a viable

target of inhibition which more effectively reduces inflammation and produces fewer and less drastic side effects.

In another portion of the arachidonic acid pathway, physiologically active leukotrienes, such as leukotriene B₄ (LTB₄), leukotriene C₄ (LTC₄) and leukotriene D₄ (LTD₄) and other metabolites, are produced by the 5-lipoxygenase-mediated (5-LO) oxidation of arachidonic acid. These leukotrienes have been implicated in various inflammation-related disorders and allergic diseases, and thus compounds which inhibit 5-lipoxygenase are useful in the treatment of disease states in which leukotrienes play an important role.

It is believed that selective dual inhibitors of both cyclooxygenase-2 and 5-lipoxygenase, which affect the two enzymes at low concentrations, will more completely and permanently affect the damage caused by the various diseases and disorders mediated by cyclooxygenase-2 and 5-lipoxygenase but without the gastrointestinal side effects associated with traditional NSAIDs.

The references below that disclose antiinflammatory activity, show continuing efforts to find a safe and effective antiinflammatory agent. The novel compounds disclosed herein are such safe and also effective antiinflammatory agents furthering such efforts. The invention's compounds are found to show usefulness in vivo as antiinflammatory agents with minimal side effects. The compounds disclosed herein preferably selectively inhibit cyclooxygenase-2 over cyclooxygenase-1.

Compounds which selectively inhibit cyclooxygenase-2 have been described in U.S. patents 5,380,738, 5,344,991, 5,393,790 and WO documents WO94/15932, WO94/27980, WO95/00501, WO94/13635, WO94/20480, and WO94/26731.

Compounds which inhibit 5-lipoxygenase have been described in U.S. patents 5,364,877, 5,302,603, 5,234,950, 5,098,932 and 5,354,865, among others.

Compounds which inhibit cyclooxygenase and 5-lipoxygenase have been described in U.S. Patent Nos. 5,298,521, 5,242,940, 5,234,939, and 5,356,898, among others. However, these previous mixed inhibitors do not selectively inhibit cyclooxygenase-2 and therefore still cause the gastrointestinal side effects which substantially reduce their usage and effectiveness.

The invention's compounds are found to show usefulness *in vivo* as dual inhibitors of cyclooxygenase-2 and 5-lipoxygenase with minimal side effects.

The term "hydrido" denotes a single hydrogen atom (H). This hydrido radical may be attached, for example, to an oxygen atom to form a hydroxyl radical or two hydrido radicals may be attached to a carbon atom to form a methylene (-CH₂-) radical. Where used, either alone or within other terms such as "haloalkyl", "alkylsulfonyl", "alkoxyalkyl" and "hydroxyalkyl", the term "alkyl" embraces linear or branched radicals having one to about twenty carbon atoms or, preferably,

one to about twelve carbon atoms. More preferred alkyl radicals are "lower alkyl" radicals having one to about ten carbon atoms. Most preferred are lower alkyl radicals having one to about six carbon atoms.

- 5 Examples of such radicals include methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, tert-butyl, pentyl, iso-amyl, hexyl and the like. The term "alkenyl" embraces linear or branched radicals having at least one carbon-carbon double bond of two to about
10 twenty carbon atoms or, preferably, two to about twelve carbon atoms. More preferred alkyl radicals are "lower alkenyl" radicals having two to about six carbon atoms. Examples of alkenyl radicals include ethenyl, propenyl, allyl, propenyl, butenyl and 4-methylbutenyl. The term
15 "alkynyl" denotes linear or branched radicals having two to about twenty carbon atoms or, preferably, two to about twelve carbon atoms. More preferred alkynyl radicals are "lower alkynyl" radicals having two to about ten carbon atoms. Most preferred are lower
20 alkynyl radicals having two to about six carbon atoms. Examples of such radicals include propargyl, butynyl, and the like. The terms "alkenyl", "lower alkenyl", embrace radicals having "cis" and "trans" orientations, or alternatively, "E" and "Z" orientations. The term
25 "cycloalkyl" embraces saturated carbocyclic radicals having three to twelve carbon atoms. More preferred cycloalkyl radicals are "lower cycloalkyl" radicals having three to about eight carbon atoms. Examples of such radicals include cyclopropyl, cyclobutyl,
30 cyclopentyl and cyclohexyl. The term "cycloalkenyl" embraces partially unsaturated carbocyclic radicals having three to twelve carbon atoms. More preferred cycloalkenyl radicals are "lower cycloalkenyl" radicals having four to about eight carbon atoms. Examples of
35 such radicals include cyclobutenyl, cyclopentenyl and cyclohexenyl. The term "halo" means halogens such as fluorine, chlorine, bromine or iodine. The term

"haloalkyl" embraces radicals wherein any one or more of the alkyl carbon atoms is substituted with halo as defined above. Specifically embraced are monohaloalkyl, dihaloalkyl and polyhaloalkyl radicals.

- 5 A monohaloalkyl radical, for one example, may have either an iodo, bromo, chloro or fluoro atom within the radical. Dihalo and polyhaloalkyl radicals may have two or more of the same halo atoms or a combination of different halo radicals. "Lower haloalkyl" embraces
- 10 radicals having 1-6 carbon atoms. Examples of haloalkyl radicals include fluoromethyl, difluoromethyl, trifluoromethyl, chloromethyl, dichloromethyl, trichloromethyl, pentafluoroethyl, heptafluoropropyl, difluorochloromethyl,
- 15 dichlorofluoromethyl, difluoroethyl, difluoropropyl, dichloroethyl and dichloropropyl. The term "hydroxyalkyl" embraces linear or branched alkyl radicals having one to about ten carbon atoms any one of which may be substituted with one or more hydroxyl
- 20 radicals. More preferred hydroxyalkyl radicals are "lower hydroxyalkyl" radicals having one to six carbon atoms and one or more hydroxyl radicals. Examples of such radicals include hydroxymethyl, hydroxyethyl, hydroxypropyl, hydroxybutyl and hydroxyhexyl. The term
- 25 "cyanoalkyl" embraces linear or branched alkyl radicals having one to about ten carbon atoms any one of which may be substituted with one or more cyano radicals. More preferred cyanoalkyl radicals are "lower cyanoalkyl" radicals having one to six carbon atoms and
- 30 one or more cyano radicals. Examples of such radicals include cyanomethyl, cyanoethyl, cyanopropyl, cyanobutyl and cyanohexyl. The terms "alkoxy" and "alkyloxy" embrace linear or branched oxy-containing radicals each having alkyl portions of one to about ten
- 35 carbon atoms. More preferred alkoxy radicals are "lower alkoxy" radicals having one to six carbon atoms. Examples of such radicals include methoxy, ethoxy,

propoxy, butoxy and tert-butoxy. The term "alkoxyalkyl" embraces alkyl radicals having one or more alkoxy radicals attached to the alkyl radical, that is, to form monoalkoxyalkyl and dialkoxyalkyl radicals. The "alkoxy" radicals may be further substituted with one or more halo atoms, such as fluoro, chloro or bromo, to provide haloalkoxy radicals, or with hydroxyl radicals to form "hydroxyalkyloxy" radicals. More preferred haloalkoxy radicals are "lower haloalkoxy" radicals having one to six carbon atoms and one or more halo radicals. Examples of such radicals include fluoromethoxy, chloromethoxy, trifluoromethoxy, trifluoroethoxy, fluoroethoxy and fluoropropoxy. More preferred hydroxyalkyloxy radicals are "lower hydroxyalkyloxy" radicals having alkyl portions of 1 to 6 carbons. The term "alkenyloxy" embraces radicals having alkenyl portions of two to about ten carbon atoms attached to an oxygen atom. More preferred alkenyloxy radicals are "lower alkenyloxy" radicals having two to six carbon atoms. The term "alkynyloxy" embraces radicals having alkynyl portions of two to about ten carbon atoms attached to an oxygen atom. More preferred alkynyloxy radicals are "lower alkynyloxy" radicals having two to six carbon atoms. Examples of such lower alkynyloxy radicals include propynyloxy, and butynyloxy. When the above radicals are included as linker moiety "Y" in Formulas I-II, such radicals are divalent radicals. In addition, the orientation of the radicals between "A" and "Ar" are reversible. For example, the term "alkylthio" represents both $-\text{CH}_2\text{S}-$ and $-\text{SCH}_2-$, and "carbonylmethyloxy" represents both $-\text{C}(\text{O})\text{CH}_2\text{O}-$ and $-\text{OCH}_2\text{C}(\text{O})-$. For terms such as aralkyl, and heteroarylalkyl, the moiety may be linked to "A" and "Ar" through a divalent alkyl radical, or through the alkyl radical at one end and the aryl or heteroaryl portion at the other. The use of heterocyclyl and aryl moieties includes divalent attachment at substitutable sites. The use of a substituted amine group, does not include attachment through a divalent nitrogen atom (i.e., $-\text{N}(\text{CH}_3)-$) but instead $(-\text{N}(\text{H})\text{CH}_2-)$.

The present invention comprises a pharmaceutical composition comprising a therapeutically-effective amount of a compound of Formulas I-II in association with at least one pharmaceutically-acceptable carrier, adjuvant or diluent.

The present invention also comprises a method of treating inflammation or inflammation-associated disorders in a subject, the method comprising treating the subject having or susceptible to such inflammation

or disorder, with a therapeutically-effective amount of a compound of Formulas I-II. The method includes prophylactic or chronic treatment, especially in the case of arthritis and other inflammatory conditions which can lead to deterioration in the joints.

Also included in the family of compounds of Formula I are the stereoisomers and tautomers thereof. Compounds of the present invention can possess one or more asymmetric carbon atoms and are thus capable of existing in the form of optical isomers as well as in the form of racemic or nonracemic mixtures thereof. Accordingly, some of the compounds of this invention may be present in racemic mixtures which are also included in this invention. The optical isomers can be obtained by resolution of the racemic mixtures according to conventional processes, for example by formation of diastereoisomeric salts by treatment with an optically active acid or base. Examples of appropriate acids are tartaric, diacetyltartaric, dibenzoyltartaric, ditoluoyltartaric and camphorsulfonic acid and then separation of the mixture of diastereoisomers by crystallization followed by liberation of the optically active bases from these salts. A different process for separation of optical isomers involves the use of a chiral chromatography column optimally chosen to maximize the separation of the enantiomers. Still another available method involves synthesis of covalent diastereoisomeric molecules by reacting an amine functionality of precursors to compounds of Formula I with an optically pure acid in an activated form or an optically pure isocyanate. Alternatively, diastereomeric derivatives can be prepared by reacting a carboxyl functionality of precursors to compounds of Formula I with an optically pure amine base. The synthesized diastereoisomers can be separated by conventional means such as chromatography, distillation, crystallization or

sublimation, and then hydrolyzed to deliver the enantiomerically pure compound. The optically active compounds of Formula I can likewise be obtained by utilizing optically active starting materials. These
5 isomers may be in the form of a free acid, a free base, an ester or a salt.

Also included in the family of compounds of Formula I are the pharmaceutically-acceptable salts thereof. The term "pharmaceutically-acceptable salts"
10 embraces salts commonly used to form alkali metal salts and to form addition salts of free acids or free bases. The nature of the salt is not critical, provided that it is pharmaceutically-acceptable. Suitable pharmaceutically-acceptable acid addition salts of

acceptable base addition salts of compounds of Formula I include metallic salts made from aluminum, calcium, lithium, magnesium, potassium, sodium and zinc or organic salts made from N,N'-dibenzylethylenediamine, chlorprocaine, choline, diethanolamine, ethylenediamine, meglumine (N-methylglucamine) and procaine. All of these salts may be prepared by conventional means from the corresponding compound of Formula I by reacting, for example, the appropriate acid or base with the compound of Formula I.

GENERAL SYNTHETIC PROCEDURES

The compounds of the invention can be synthesized according to the following procedures of Schemes I-XXIII, wherein the R^1 - R^9 substituents are as defined for Formula I-II, above, except where further noted.

Scheme I

Synthetic Scheme I shows the preparation of sulfonylphenyl derivatives 3, where one of Z or W is a leaving group. A substituted aromatic or heteroaryl 2, such a tetrahydropyran substituted aryl, and a base such as anhydrous potassium carbonate are dissolved in anhydrous solvent such as DMF. A solution of sulfonylphenyl derivative 1 in anhydrous DMF is added and stirred at room temperature to provide the sulfonylphenyl derivatives 3.

Scheme II

Synthetic Scheme II shows the preparation of pyrazole compounds embraced by Formula I where R is Ar or Z (as defined in Scheme I), and R^a is a radical defined above for the substituents optionally substituted on A. In step 1, ketone 4 is treated with a base, preferably NaOMe or NaH, and an ester, or ester equivalent, to form the intermediate diketone 5 (in the enol form) which is used without further purification. In step 2, diketone 5 in an anhydrous protic solvent, such as absolute ethanol or acetic acid, is treated with the hydrochloride salt or the free base of a substituted hydrazine at reflux to afford a mixture of pyrazoles 6 and 7. Recrystallization from diethyl ether/hexane or chromatography affords 6 usually as a solid. Similar pyrazoles can be prepared by methods described in U.S.

Pat. Nos. 4,146,721, 5,051,518, 5,134,142 and 4,914,121 which are incorporated by reference.

Scheme III

Scheme III shows the four step procedure for forming pyrazoles 11 of the present invention (where R^b is alkyl) from ketones 8. In step 1, ketone 8 is reacted with a base, such as lithium bis(trimethylsilyl)amide or lithium diisopropylamide (LDA) to form the anion. In step 2, the anion is reacted with an acetylating reagent to provide diketone 9. In step 3, the reaction of diketone 9 with hydrazine or a substituted hydrazine, gives pyrazole 10. In step 4, the pyrazole 10 is oxidized with an oxidizing reagent, such as Oxone[®] (potassium peroxymonosulfate), 3-chloroperbenzoic acid (MCPBA) or hydrogen peroxide, to give a mixture of the desired 3-(alkylsulfonyl)phenyl-pyrazole 11 and the 5-(alkylsulfonyl)phenyl-pyrazole isomer. The desired pyrazole 11, usually a white or pale yellow solid, is obtained in pure form either by chromatography or recrystallization.

Alternatively, diketone 9 can be formed from ketone 8 by treatment with a base, such as sodium

hydride, in a solvent, such as dimethylformamide, and further reacting with a nitrile to form an aminoketone. Treatment of the aminoketone with acid forms the diketone 9. Similar pyrazoles can be prepared by methods described in U.S. Pat. No. 3.984,431 which is incorporated by reference.

Scheme IV

Diaryl/heteroaryl thiophenes (where T is S, and R^b is alkyl) can be prepared by the methods described in U.S. Patent Nos. 4,427,693, 4,302,461, 4,381,311, 4,590,205, and 4,820,827, and PCT documents WO 95/00501 and WO94/15932, which are incorporated by reference. Similar pyrroles (where T is N), furanones and furans (where T is O) can be prepared by methods described in PCT documents WO 95/00501 and WO94/15932.

Scheme V

Diaryl/heteroaryl oxazoles can be prepared by the methods described in U.S. Patent Nos. 3,743,656, 3,644,499 and 3,647,858, and PCT documents WO 95/00501 and WO94/15932, which are incorporated by reference.

Scheme VI

5 Diaryl/heteroaryl isoxazoles can be prepared by
the methods described in PCT documents WO92/05162, and
WO92/19604, and European Publication EP 26928 which
are incorporated by reference. Sulfonamides 27 can be
formed from the hydrated isoxazole 26 in a two step
10 procedure. First, hydrated isoxazole 26 is treated at
about 0 °C with two or three equivalents of
chlorosulfonic acid to form the corresponding sulfonyl
chloride. In step two, the sulfonyl chloride thus
formed is treated with concentrated ammonia to provide
15 the sulfonamide derivative 27.

5 Scheme VII shows the three step preparation of
the substituted imidazoles 32 of the present
invention. In step 1, the reaction of substituted
nitriles (R^1CN) 28 with primary phenylamines 29 in the
presence of alkylaluminum reagents such as
10 trimethylaluminum, triethylaluminum, dimethylaluminum
chloride, diethylaluminum chloride in the presence of
inert solvents such as toluene, benzene, and xylene,
gives amidines 30. In step 2, the reaction of amidine
30 with 2-haloketones (where X is Br or Cl) in the
15 presence of bases, such as sodium bicarbonate,
potassium carbonate, sodium carbonate, potassium
bicarbonate or hindered tertiary amines such as N,N' -

diisopropylethylamine, gives the 4,5-dihydroimidazoles 31 (where R^b is alkyl, R^c is hydroxyl and R^d is hydrido). Some of the suitable solvents for this reaction are isopropanol, acetone and

5 dimethylformamide. The reaction may be carried out at temperatures of about 20°C to about 90°C. In step 3, the 4,5-dihydroimidazoles 31 may be dehydrated in the presence of an acid catalyst such as 4-toluenesulfonic acid or mineral acids to form the 1,2-disubstituted
10 imidazoles 32 of the invention. Suitable solvents for this dehydration step are e.g., toluene, xylene and benzene. Trifluoroacetic acid can be used as solvent and catalyst for this dehydration step.

In some cases (e.g., where YR = methyl or phenyl),
15 the intermediate 31 may not be readily isolable. The reaction, under the conditions described above, proceeds to give the targeted imidazoles directly.

Similarly, imidazoles can be prepared having the sulfonylphenyl moiety attached at position 2 and R^1
20 attached at the nitrogen atom at position 1. Diaryl/heteroaryl imidazoles can be prepared by the methods described in U.S. Patent Nos. 4,822,805, and PCT document WO 93/14082, which are incorporated by
reference.

Scheme VIII

5 The subject imidazole compounds 39 of this invention may be synthesized according to the sequence outlined in Scheme VIII. Aldehyde 33 may be converted to the protected cyanohydrin 34 by reaction with a trialkylsilyl cyanide, such as trimethylsilyl cyanide (TMSCN) in the presence of a catalyst such as zinc

10

iodide (ZnI_2) or potassium cyanide (KCN). Reaction of cyanohydrin 34 with a strong base followed by treatment with benzaldehyde 35 (where R^2 is alkyl) and using both acid and base treatments, in that order, on workup gives benzoin 36. Examples of strong bases suitable for this reaction are lithium diisopropylamide (LDA) and lithium hexamethyldisilazane. Benzoin 36 may be converted to benzil 37 by reaction with a suitable oxidizing agent, such as bismuth oxide or manganese dioxide, or by a Swern oxidation using dimethyl sulfoxide (DMSO) and trifluoroacetic anhydride. Benzil 37 may be obtained directly by reaction of the anion of cyanohydrin 34 with a substituted benzoic acid halide. Any of compounds 36 and 37 may be used as intermediates for conversion to imidazoles 38 (where R^2 is alkyl) according to chemical procedures known by those skilled in the art and described by M. R. Grimmett, "Advances in Imidazole Chemistry" in *Advances in Heterocyclic Chemistry*, 12, 104 (1970). The conversion of 37 to imidazoles 38 is carried out by reaction with ammonium acetate and an appropriate aldehyde (RYCHO) in acetic acid. Benzoin 36 may be converted to imidazoles 38 by reaction with formamide. In addition, benzoin 36 may be converted to imidazoles by first acylating with an appropriate acyl group (RYCO-) and then treating with ammonium hydroxide. Those skilled in the art will recognize that the oxidation of the sulfide (where R^2 is methyl) to the sulfone may be carried out at any point along the way beginning with compounds 35, and including oxidation of imidazoles 38, using, for examples, reagents such as hydrogen peroxide in acetic acid, *m*-chloroperoxybenzoic acid (MCPBA) and potassium peroxymonosulfate (OXONE®).

Diaryl/heteroaryl imidazoles can be prepared by the methods described in U.S. Patent Nos. 3,707,475, 4,686,231, 4,503,065, 4,472,422, 4,372,964, 4,576,958, 3,901,908, European publication EP 372,445, and PCT document WO 95/00501, which are incorporated by reference.

and PCT document WO 95/00501, which are incorporated by reference.

Scheme X

5

Similarly, Synthetic Scheme X shows the procedure for the preparation of 1,2-diarylbenzene antiinflammatory agents 47 from 2-bromo-biphenyl intermediates 46 (prepared similar to that described in Synthetic Scheme IX) and the appropriate substituted phenylboronic acids. Using a coupling procedure similar to the one developed by Suzuki et al. [*Synth. Commun.*, 11, 513 (1981)], intermediates 46 are reacted with the boronic acids in toluene/ethanol at reflux in the presence of a Pd⁰ catalyst, e.g., tetrakis(triphenylphosphine)palladium(0), and 2M sodium carbonate to give the corresponding 1,2-diarylbenzene antiinflammatory agents 47 of this invention.

Scheme XI

the methods described in U.S. Patent No. 4,051,250,
4,632,930, European Application EP 592,664, and PCT
document WO 95/00501, which are incorporated by
reference. Isothiazoles can be prepared as described
10 in PCT document WO 95/00501.

Scheme XII

5 Diaryl/heteroaryl pyridines can be prepared by the
 methods described in U.S. Patent Nos. 5,169,857,
 4,011,328, and 4,533,666, which are incorporated by
 reference. For example, Synthetic Scheme XII shows the
 procedure used to prepare 3-alkylcarbonylaminoalkyl
 10 pyridine antiinflammatory agents 53, 3-haloalkyl

pyridine antiinflammatory agents 55, 3-hydroxyalkyl
pyridine antiinflammatory agents 56, heteroatom
substituted 3-alkyl pyridine antiinflammatory agents 58
and 3-aryloxyalkyl pyridine antiinflammatory agents 59
5 from the corresponding carbonitriles 51. The 3-
alkylcarbonylaminoalkyl pyridine antiinflammatory agents
53 (where R' is alkyl) are prepared in a two step
procedure from the carbonitriles 51. In step one, the
carbonitrile 51 is reduced using reducing agents, such
10 as diisobutyl aluminum hydride (DIBAL) in a solvent such
as toluene or boranes in a solvent such as
tetrahydrofuran, at room temperature or reflux to form
the aminoalkyl pyridine 52. Additional reducing reagent
may be added to the solution. In step two, an acid
15 chloride is added to the aminoalkyl pyridine 52 in a
solvent such as ethyl ether or tetrahydrofuran and
stirred to form the alkylcarbonylaminoalkyl pyridines
53. The 3-haloalkyl pyridine antiinflammatory agents 55
are prepared in a two step procedure from the
20 carbonitriles 51. In step one, the carbonitriles 51 are
reduced using agents, such as diisobutyl aluminum
hydride (DIBAL) in a solvent such as toluene, at room
temperature to form the aldehydes 54. The 3-
hydroxyalkyl pyridines 56 also can be isolated from this
25 reaction. In step two, a halogenating agent, such as
diethylamino sulfur trifluoride (DAST) is added to the
aldehyde 54 to form the haloalkyl pyridines 55.
Reduction of aldehydes 54 with agents such as diisobutyl
aluminum hydride (DIBAL) followed by methanol and water
30 in methanol to yield the 3-hydroxyalkyl pyridines 56.
Compound 56 is convertible to alkoxyalkyl and
aralkoxyalkyl compounds 59 by sequential treatment first
with a base and then with an alkyl or aralkyl halide.
An example of a suitable base is sodium hydride.
35 Examples of alkyl and aralkyl halides are methyl iodide
and benzyl chloride. Alternatively, compound 56 may be
converted to the haloalkyl compound 57 using a suitable

halogenating agent, such as thionyl chloride. Under such circumstances, the hydrochloride salt may be isolated. This in turn may be converted to compounds 58 by reaction with the appropriate alcohol, thiol, or amine. It may be advantageous to carry out this reaction in the presence of a base. Examples of suitable alcohols are methanol, ethanol, benzyl alcohol and phenol. Examples of suitable thiols are n-butyl mercaptan, benzylthiol and thiophenol. Examples of suitable amines are dimethylamine, benzylamine, N-methylbenzylamine, aniline, N-methylaniline and diphenylamine. Examples of suitable bases are sodium hydride and potassium carbonate. Alternatively, amines are accessible by reaction of aldehyde 54 with a primary or secondary amine in the presence of a reducing agent. Examples of suitable primary amines are methyl amine and ethylamine. An example of a suitable secondary amine is dimethylamine. Suitable reducing agents include sodium cyanoborohydride and sodium borohydride.

Scheme XIII

Scheme XIII shows a method to form the alkylsulfonylphenyl substituted heterocycles 61 of the current invention by oxidation of alkylthio or alkylsulfinyl derivatives 60. Aqueous hydrogen peroxide (30%) is added to a suspension of a (methylthio)phenyl substituted heterocycle 60 in acetic acid. The mixture is stirred while heating to about 100°C for about 2 hours. Alternatively, m-chloroperoxybenzoic acid (MCPBA), and other oxidizing

agents [potassium peroxymonosulfate (OXONE®)] can be used to form the sulfonyl radicals 61.

Scheme XIV

64

Synthetic Scheme XIV shows the three step procedure used to prepare sulfonamide antiinflammatory agents 63 and the two step procedure used to prepare fluoromethyl sulfone antiinflammatory agents 64 from their corresponding methyl sulfones 62. In step one, THF solutions of the methyl sulfones 62 at -78°C are treated with an alkylolithium reagent, e.g., methylolithium, n-butyolithium, etc. In step two, the anions generated in step one are treated with an organoborane, e.g., triethylborane, tributylborane, etc., at -78°C then allowed to warm to ambient temperature prior to stirring at reflux. In step three, an aqueous solution of sodium acetate and hydroxylamine-O-sulfonic acid is added to provide the corresponding sulfonamide antiinflammatory agents 63 of this invention. As an alternative to the borane

chemistry found in step two above, the base treated sulfone is reacted with an alkylsilane, such as (iodomethyl)trimethylsilane or (chloromethyl)trimethylsilane, at room temperature to give a silylalkylsulfone. The silylalkylsulfone is converted to a sulfinic acid salt by heating to about 90°C with tetrabutylammonium fluoride. Treatment proceeds as in step three above to produce the sulfonamide.

Alternatively, the anion solutions generated in step one may be warmed to 0°C and treated with N-fluorodibenzzenesulfonamide to provide the corresponding fluoromethyl sulfone antiinflammatory agents 64 of this invention.

Scheme XV

Synthetic Scheme XV shows the four step procedure used to prepare anti-inflammatory compound of Formula II. In step one, a dichloromethane solution of 1-
5 (substitutedphenyl)-2-hydroxy-2-[4-(methylsulfonyl)phenyl]ethanone 65 (described in U. S. Patent 5,380,738) is treated with benzyloxyacetyl chloride in the presence of pyridine base to provide 2-benzyloxymethyl-4-(substitutedphenyl)-5-[4-
10 (methylsulfonyl)phenyl]oxazole 66 in good yield. In step two, the benzyloxy group is removed by hydrogenolysis in the presence of a catalytic amount of 10% palladium on charcoal to provide the hydroxymethyl compound 67. In step three, the hydroxymethyl compound
15 67 is treated with a solution of methanesulfonyl chloride in the presence of triethylamine base to produce the unstable mesylate 68 that is used directly in the next step. In step four, a mixture of the mesylate and a 3,4,5,6-tetrahydro-2H pyran in
20 dimethylformamide (DMF) is treated with potassium carbonate to effect ether formation and provide the anti-inflammatory agents 69 (where R^f is halo, alkoxy, or alkyl) of the present invention.

Scheme XVI

- 5 Synthetic Scheme XVI shows the four step procedure
 that is used to prepare anti-inflammatory compound of
 Formula II. In step one, benzoin 70 is mixed with
 ethyl carbamate (urethane) and heated to reflux to
 provide oxazolone 71 in high yield. In step two,
 10 oxazolone 71 is treated with a mixture of phosphorus
 oxychloride and triethylamine base to produce 2-chloro-
 5-phenyloxazole 72. In step three, 2-chloro-5-
 phenyloxazole 72 is treated first with chlorosulfonic
 acid to effect regioselective chlorosulfonation,
 15 followed by treatment with aqueous ammonia provides 2-
 chloro-5-(4-sulfonamido)phenyloxazole 73 in high yield.

In step four, 2-chloro-5-(4-sulfonamido)phenyloxazole 73 and a tetrahydro-2H-pyran-substituted phenol is treated with potassium carbonate to effect ether formation and provide the anti-inflammatory agents of the present invention 74.

Scheme XVII

Synthetic Scheme XVII shows a four step method of making the pyrazole phenylethers 79 of the present invention. In step 1, the dione 76 is formed from

ketone 75 through the addition of a base, such as lithium bis(trimethylsilyl)amide or lithium diisopropylamide (LDA), followed by reacting with an appropriate acetylating reagent, such as $(\text{CO}_2\text{CH}_3)_2$.

- 5 Treatment of the dione 76 with a phenylhydrazine yields the pyrazole ester 77. The pyrazole ester 77 is first treated with base to hydrolyze the ester and is then reduced to the alcohol 78 by treatment with borane in THF. In step four, the alcohol 78 is treated with
- 10 methanesulfonyl chloride in the presence of triethylamine base to produce the unstable mesylate that is directly reacted with a 3,4,5,6-tetrahydro-2H pyran in dimethylformamide and K_2CO_3 to effect ether formation and provide the anti-inflammatory agents 79
- 15 of the present invention.

Scheme XVIII

- 5 Scheme XVIII shows a procedure for forming an
 alkynyl oxazole 84 (where R² is amino), similar to that
 shown in Scheme V above. The ketone sulfonamide 81 is
 formed from ketone 80 through chlorosulfonation and
 ammonolysis with ammonium hydroxide in a solvent such
 10 as acetone. The ketone sulfonamide 81 is halogenated,
 such as with HBr in acetic acid and bromine, to form
 the haloketone sulfonamide 82. Substitution with
 butynoic acid in the presence of K₂CO₃, a crown ether,
 such as 18-crown-6, and dimethylacetamide (DMA) yields

the alkynyl ketoester 83. Conversion of the alkynyl ester 83 to the alkynyl oxazole 84 proceeds as previously described in Scheme V.

5

Scheme XIX

- 10 Synthetic Scheme XIX shows the procedures for forming heterocycloalkynylethers 87, heterocyclotriazole ethers 88 and heterocycloalkylethers 89, from the corresponding alkynes 85. The alkynes 85 are halogenated such as
- 15 with N-bromosuccinimide (NBS) and 2,2'-azobis(2-methylpropionitrile) (AIBN) to form the haloalkynes 86. Substitution with the appropriate aryl or aralkyl alcohols in the presence of potassium carbonate yields the alkynyl ethers 87 of the present invention. The
- 20 alkynylethers 87 can be converted to heterocyclo-

containing spacers 88 by treatment with
 azidotrimethylsilane, followed by acid. Alternatively,
 the alkynylethers 87 can be reduced, such as with
 hydrogen in the presence of catalyst, such as
 5 palladium, to yield the heterocycloalkylethers 89.

Scheme XX

10 Scheme XX shows another method of forming the
 alkynylethers 92, alkylethers 93, alkenylethers 94 and
 the diols 95 of the present invention from the
 appropriate alkynes 90. In Step one, the alkynes 90
 (where P is a protecting group such as -
 15 tetrahydropyranyl, trialkylsilyl, tert-

butyldimethylsilyl or diphenylalkylsilyl) are acid treated to form the alkynyl alcohols 91. Substitution of the alcohol 91 with aralkyl halides or heteroaryl halides in the presence of 1,8-

- 5 diazabicyclo[5.4.0]undecane (DBU) yields the propynylethers 92 of the present invention. Reduction of the alkynylethers 92 with hydrogen in the presence of metal catalyst yields the alkylethers 93. Alternatively, treatment with diimide reduces the
- 10 alkynylethers 92 to the alkenylethers 94. Oxidation of the alkenylether 94, such as with osmium tetroxide and hydrogen peroxide, yields the diols 95 of the present invention.

Scheme XXI

Additional antiinflammatory agents containing various substituted alkylether spacer radicals including carbonylalkylethers 98, aminoalkylethers 100, hydroxyalkylethers 101, oxyiminoalkylethers 99, and amidoalkylethers 102, can be prepared from ketones 96, by the procedures shown in Scheme XXI. The ketones 96 are halogenated to form halomethylketone 97 such as by treatment with NBS in the presence of AIBN. Substitution of appropriate alcohols with the halides 97 in the presence of base, such as potassium carbonate, generates the ketoalkylethers 98. The

ketoalkylethers 98 can be converted to the oxyimino-containing spacers 99 (where R⁹ is alkyl) by treatment with substituted oxyamines, such as hydroxylamine.

Hydroxyalkyl spacers 101 can be prepared by reducing the carbonyl in the ketoalkylethers 99 such as with sodium borohydride. Amination of the ketoalkylethers 99 by reaction with ammonium acetate and sodium cyanoborohydride in the presence of acetic acid generates the aminoalkylethers 100. Acetylation of

the aminoethers 100 by acid chlorides or anhydrides in the presence of base, such as trialkylamines, produces the amidoalkylethers 102.

Scheme XXII

Scheme XXII shows the preparation of ethers 105 and amides 107 antiinflammatory agents of the present invention. Esters 103 where R¹ is alkyl, can be

converted to the alcohols 104 by treatment with a reducing agent, such as DIBAL-H. The ethers 105 are formed by reacting with an aralkyl halide in the presence of base. Alternatively, the esters 103 can be hydrolyzed to the acids 106 with base such as LiOH. Amides 107 are formed from the acid 106 by treatment with thionyl chloride to form the acid chlorides, followed by substitution with aralkylamines.

10

Scheme XXIII

Scheme XXIII shows the preparation of the antiinflammatory esters 109 and amides 110 of the present invention. Base treatment of ester 108, such as with sodium hydride, followed by addition of an aralkyl halide or heteroaralkyl halide forms the ester 109. Formation of

the amide 110 from the esters 109 occurs in a three step procedure. Treatment with base, such as lithium hydroxide, and thionyl chloride yields the acid chloride. Addition of

Scheme XXIV

Scheme XXIV shows the preparation of the antiinflammatory ethers and thioethers 116 of the present

invention. Ethyl bromoacetate is added to a mixture of hydroxy or mercaptan-substituted-(tetrahydro-2H-pyran-4-yl)benzene 111 and base to give the acetate 112. The acid 113 is formed from acetate 112 such as by treatment with
 5 ethanolic LiOH. Addition of bromoethanone 114 to the acid 115 in a solvent such as dimethylformamide gives the benzoin ester 115. The benzoin ester 115 is heated with acetic acid and ammonium acetate to give the oxazole 116.

10

Scheme XXV

Scheme XXV shows the preparation of the antiinflammatory amides 123 and amines 124 of the present invention. Protected amino acid 118 and bromoethanone 117 is treated with base and 18-crown-6 to afford the benzoin ester 119. This benzoin ester 119 is treated with acetic acid and ammonium acetate and heated to provide the protected 2-(aminoalkyl)oxazole 120. The protected 2-(aminoalkyl)oxazole 120 is deprotected, such as by hydrogenation with 10% Pd on carbon, to give the 2-(aminoalkyl)oxazole 121. (Tetrahydro-2H-pyran-4-yl)phenoxyacetic acid derivative 122 is coupled with 2-(aminoalkyl)oxazole 121 such as with HOBt and EDC to afford amide 123. Reduction of amide 123 such as with LiAlH_4 provides the amine 124.

Scheme XXVI

5 Scheme XXVI shows the preparation of the
 antiinflammatory ether derivatives 130 of the present
 invention. A solution of the appropriate hetero-
 substituted ester and base is added to a
 10 [(tetrahydropyran-4-yl)- α -bromotoluene 125 to give the
 [(tetrahydropyran-4-yl)phenylmethyl ester 126. The
 acid 127 is formed from ester 126 such as by treatment

with ethanolic LiOH. Base is added to acid 127 and 2-bromoethanone 128 is added to form the benzoin ester 129. Acetic acid and ammonium acetate are added to benzoin ester 129 and heated to give the oxazole 130.

5

Scheme XXVII

134

Scheme XXVII shows a method for preparing oxazoles 135. A solution of aldehyde 131 and zinc iodide in an organic solvent such as dichloromethane is treated with trimethylsilylcyanide to give the trimethylsilyl cyanohydrin. The trimethylsilyl cyanohydrin is added to a solution of R¹-magnesium bromide in diethyl ether while maintaining the temperature between 25-35 °C to give the benzoin 132. The benzoin 132, pyridine, and acid chloride are reacted at room temperature to yield the benzoin ester 133. Addition of ammonium acetate to the benzoin ester 133 and heating yields the oxazole 135. Alternatively, the hydroxy-oxazoline 134 is isolated. Dehydration of the hydroxy-oxazoline 134 yields the oxazoles 135. By reversing the positions

of R¹ and the phenyl group in benzoin 132, oxazoles can be prepared where R¹ is at position 4.

Scheme XXVIII

10 Scheme XXVIII shows a method of preparing oxazolybenzenesulfonamides 138 of the present invention. The oxazole 136 is stirred with chlorosulfonic acid at about 5 °C to give the sulfonyl chlorides 137. The sulfonyl chloride 137 is reacted at about 5 °C with ammonium hydroxide to give the sulfonamides 138 of the current invention.

These detailed descriptions fall within the scope, and serve to exemplify, the above described General Synthetic Procedures which form part of the invention. These detailed descriptions are presented for illustrative purposes only and are not intended as a restriction on the scope of the invention. All parts are by weight and temperatures are in Degrees centigrade unless otherwise indicated. All compounds showed NMR spectra consistent with their assigned structures.

Example 1

Step 1. Preparation of methyl-4-(4-chlorophenyl)-2,4-dioxobutanoate.

Dimethyl oxalate (15.27 g, 0.129 mol) and 4'-chloroacetophenone (20.0 g, 0.129 mol) were diluted with methanol (300 mL) and sodium methoxide (25 wt% in methanol, 70 mL) was added in one portion. The reaction was stirred at room temperature for 16 hours

(the reaction became an insoluble mass during this time). The solid was mechanically broken up, hydrochloric acid (conc. 70 mL) was added, and the white suspension was stirred vigorously at room temperature for 1 hour. The suspension was cooled to 0 °C and held for 0.5 hour. The solid was filtered, and the filter cake was washed with cold water (100 mL). Upon drying, methyl-4-[4-(chloro)phenyl]-2,4-dioxobutanoate was obtained (16.94 g, 54.4%) as the enol: mp 108.5-110.5 °C. ¹H NMR (CDCl₃/300 MHz) δ 7.94 (d, J=8.66 Hz, 2H), 7.48 (d, J=8.66 Hz, 2H), 7.04 (s, 1H), 3.95 (s, 3H), 3.48 (s, 1H).

Step 2. Preparation of methyl 1-(4-aminosulfonylphenyl)-5-(4-chlorophenyl)-1H-pyrazole-3-carboxylate

Methyl-4-[4-(chloro)phenyl]-2,4-dioxobutanoate (5.0 g, 20.78 mmol) was added to 4-sulfonamidylphenyl hydrazine hydrochloride (5.11 g, 22.86 mmol) and methanol (50 mL). The reaction vessel was heated to reflux and held for 16 hours. A precipitate formed overnight. Mass Spectrum, MH⁺ = 392. Anal. Calc'd for C₁₇H₁₄N₃O₄ClS: C, 52.11; H, 3.60; N, 10.72; Cl, 9.05; S, 8.18. Found: C, 52.07; H, 3.57; N, 10.76; Cl, 9.11; S, 8.27.

Step 3. Preparation of 1-(4-aminosulfonylphenyl)-5-(4-chlorophenyl)-1H-pyrazole-3-carboxylic acid

Methyl 1-(4-aminosulfonylphenyl)-5-(4-chlorophenyl)-1H-pyrazole-3-carboxylate (1.0 g, 2.66 mmol) was added to tetrahydrofuran (20 mL). Aqueous sodium hydroxide (2.5 N, 2.7 mL) and water (2.5 mL) were added, and the suspension was heated to reflux and held for 16 hours. The solids all dissolved during this time. The reaction was cooled to room temperature, and hydrochloric acid solution (1 N, 11 mL) was added. The aqueous suspension was extracted with methylene chloride (2x20 mL). The combined organic solution was dried over anhydrous magnesium sulfate, filtered, and concentrated in vacuo to an oil. Trituration with 30 mL of dichloromethane yielded, upon filtration and drying, 0.90 g (94%) of 1-(4-aminosulfonylphenyl)-5-(4-chlorophenyl)-1H-pyrazole-3-carboxylic acid as a white solid: mp 126-128 °C.

Step 4. Preparation of 4-[5-(4-chlorophenyl)-3-hydroxymethyl-1H-pyrazol-1-yl]benzenesulfonamide.

4-[4-(Aminosulfonyl)phenyl-5-(4-chlorophenyl)-1H-pyrazole-3-carboxylic acid (3.8 g, 10 mmol) and tetrahydrofuran (100 mL) was stirred at room temperature during the dropwise addition of 1.0 M borane-tetrahydrofuran complex (30 mL, 30 mmol). The mixture was allowed to reflux for 16 hours. The solution was cooled and methanol was added dropwise until gas evolution ceased. Ethyl acetate (100 mL) was added and the solution washed with 1N hydrochloric acid, brine, sat. aq. sodium bicarbonate solution, dried over magnesium sulfate, filtered and concentrated. The resultant material was recrystallized from ethanol:water to yield 4-[5-(4-chlorophenyl)-3-hydroxymethyl-1H-pyrazol-1-yl]benzenesulfonamide (2.6 g, 71%) as a white solid: mp 192-194 °C; ¹H NMR (DMSO-d₅/300 MHz) δ 7.81 (d, J=8.7 Hz, 2H), 7.46 (d, J=8.4 Hz, 2H), 7.42 (brs, 2H),

Step 5. Preparation of 4-[5-(4-chlorophenyl)-3-[[3-fluoro-5-(3,4,5,6-tetrahydro-4-methoxy-2H-pyran-4-yl)phenoxy]methyl]-1H-pyrazol-1-yl]benzenesulfonamide.

A solution of (569 mg, 1.56 mmol) of 4-[5-(4-chlorophenyl)-3-hydroxymethyl-1H-pyrazol-1-yl]benzenesulfonamide in 50 mL of dichloromethane was stirred at 25 °C as triethylamine (315 mg, 3.12 mmol) was added dropwise, followed by the addition of methanesulfonyl chloride (215 mg, 1.88 mmol). The reaction was stirred for 5 minutes, after which the organic solution was washed with 1N HCl, dried over sodium sulfate and concentrated in vacuo to give a yellow oil (500 mg), which was characterized as the expected mesylate by its NMR spectrum. This material was used without further purification. 4-(5-Fluoro-3-hydroxyphenyl)-4-methoxytetrahydropyran (373 mg, 1.649 mmol) and anhydrous potassium carbonate (228 mg, 1.649 mmol) were dissolved in 25 mL of anhydrous DMF. The solution was stirred at room temperature under a blanket of dry nitrogen for 20 minutes, then a solution of mesylate (500 mg, 1.374 mmol) in anhydrous DMF (15 mL) was added in one portion. The resulting solution was stirred at room temperature for 72 hours, then 1N HCl (30 mL) was added. After stirring an additional 0.5 hour, the system was extracted with ethyl acetate (2x40 mL). The combined organic solution was sequentially washed with 1 N HCl (40 mL), saturated aqueous $NaHCO_3$ (2x40 mL), 50% saturated NaCl (2x40 mL), and brine (40 mL), dried over $MgSO_4$ and filtered. The solvents were evaporated under reduced pressure to yield an oil. The oil was purified by flash chromatography on silica gel eluting with 40%

ethyl acetate in hexane to yield, upon concentration of the appropriate fractions (200 mg, 25%) of 4-[5-(4-chlorophenyl)-3-[[3-fluoro-5-(3,4,5,6-tetrahydro-4-methoxy-2H-pyran-4-yl)phenoxy]methyl]-1H-pyrazol-1-yl]benzenesulfonamide as a foam: Mass Spectrum: 572 (M⁺). Patent 5,380,738, Jan. 10, 1995) in 100 mL of dichloromethane was stirred at 25 °C as (2.71 mL, 33.55 mmol) of pyridine was added, followed by the addition of (1.27 mL, 8.05 mmol) of benzyloxyacetyl chloride. The

BIOLOGICAL EVALUATION

Rat Carrageenan Foot Pad Edema Test

30

The carrageenan foot edema test was performed with materials, reagents and procedures essentially as described by Winter, et al., (*Proc. Soc. Exp. Biol. Med.*, 111, 544 (1962)). Male Sprague-Dawley rats were selected in each group so that the average body weight was as close as possible. Rats were fasted with free access to water for over sixteen hours prior

35

to the test. The rats were dosed orally (1 mL) with compounds suspended in vehicle containing 0.5% methylcellulose and 0.025% surfactant, or with vehicle alone. One hour later a subplantar injection of 0.1 mL of 1% solution of carrageenan/sterile 0.9% saline was administered and the volume of the injected foot was measured with a displacement plethysmometer connected to a pressure transducer with a digital indicator. Three hours after the injection of the carrageenan, the volume of the foot was again measured. The average foot swelling in a group of drug-treated animals was compared with that of a group of placebo-treated animals and the percentage inhibition of edema was determined (Otterness and Bliven, Laboratory Models for Testing NSAIDs, in Non-steroidal Anti-Inflammatory Drugs, (J. Lombardino, ed. 1985)). The % inhibition shows the % decrease from control paw volume determined in this procedure and the data for selected compounds in this invention are summarized in Table I.

Evaluation of COX-1 and COX-2 activity *in vitro*

The compounds of this invention exhibited inhibition *in vitro* of COX-2. The COX-2 inhibition activity of the compounds of this invention illustrated in the Examples was determined by the following methods.

a. Preparation of recombinant COX baculoviruses

Recombinant COX-1 and COX-2 were prepared as described by Gierse et al, [*J. Biochem.*, 305, 479-84 (1995)]. A 2.0 kb fragment containing the coding region of either human or murine COX-1 or human or murine COX-2 was cloned into a BamHI site of the baculovirus transfer vector pVL1393 (Invitrogen) to generate the baculovirus transfer vectors for COX-1 and COX-2 in a manner similar to the method of D.R. O'Reilly et al (*Baculovirus Expression Vectors: A Laboratory Manual* (1992)). Recombinant baculoviruses were isolated by transfecting 4 µg of baculovirus transfer vector DNA into SF9 insect cells (2×10^8) along with 200 ng of linearized baculovirus plasmid DNA by the calcium phosphate method. See M.D. Summers and G.E. Smith, *A Manual of Methods for Baculovirus Vectors and Insect Cell Culture Procedures*, Texas Agric. Exp. Station Bull. 1555 (1987). Recombinant viruses were purified by three rounds of plaque purification and high titer (10^7 - 10^8 pfu/ml) stocks of virus were prepared. For large scale production, SF9 insect cells were infected in 10 liter fermentors (0.5×10^6 /ml) with the recombinant baculovirus stock such that the multiplicity of infection was 0.1. After 72 hours the cells were centrifuged and the cell pellet homogenized in Tris/Sucrose (50 mM: 25%, pH 8.0) containing 1% 3-[(3-cholamidopropyl)dimethylammonio]-1-propanesulfonate (CHAPS). The homogenate was centrifuged at 10,000xg for 30 minutes, and the resultant supernatant was stored at -80°C before being assayed for COX activity.

b. Assay for COX-1 and COX-2 activity

COX activity was assayed as PGE₂ formed/µg protein/time using an ELISA to detect the prostaglandin released. CHAPS-solubilized insect cell

membranes containing the appropriate COX enzyme were incubated in a potassium phosphate buffer (50 mM, pH 8.0) containing epinephrine, phenol, and heme with the addition of arachidonic acid (10 μ M). Compounds were
5 pre-incubated with the enzyme for 10-20 minutes prior to the addition of arachidonic acid. Any reaction between the arachidonic acid and the enzyme was stopped after ten minutes at 37°C/room temperature by transferring 40 μ l of reaction mix into 160 μ l ELISA
10 buffer and 25 μ M indomethacin. The PGE₂ formed was measured by standard ELISA technology (Cayman Chemical). Results are shown in Table II.

Assay for 5-Lipoxygenase activity

15

The 5-lipoxygenase (5-LO) activity of the compounds were determined by the calcium ionophore-induced Leukotriene B₄ (LTB₄) production in human whole blood. Venous blood was collected from healthy
20 human donors using heparin as an anti-coagulant. Human blood samples (0.2 ml of a 1:4 dilution in RPMI 1640 medium) were incubated in 96-well culture plates for 15 minutes at 37°C with test compounds dissolved in ethanol (EtOH; final concentration <1%), or vehicle.
25 Typically 7 concentrations of test compounds were examined in duplicate. A-23187 [Sigma] was added to the blood to a final concentration of 20 μ g/ml, and the mixtures were incubated for 10 minutes at 37°C. The reaction was stopped by placing the samples on
30 ice. The samples were then centrifuged at 800 x g at 4°C for 10 minutes to pellet the cells, and the supernatants were recovered for quantitation of LTB₄ by ELISA (Cayman Chemical Co.; sensitivity 3 pg/ml). IC₅₀'s were estimated from a four parameter logistic
35 model with two parameters fixed, the minimum (0% inhibition) and maximum (100% inhibition). The IC₅₀ value is the concentration that produces 50%

inhibition between the fixed values of the minimum and maximum. Data is reported as the mean IC₅₀ for each compound. Results are shown in Table II.

Also embraced within this invention is a class of pharmaceutical compositions comprising the active compounds of this combination therapy in association with one or more non-toxic, pharmaceutically-acceptable carriers and/or diluents and/or adjuvants (collectively referred to herein as "carrier" materials) and, if desired, other active ingredients. The active compounds of the present invention may be administered by any suitable route, preferably in the form of a pharmaceutical composition adapted to such a route, and

in a dose effective for the treatment intended. The active compounds and composition may, for example, be administered orally, intravascularly (IV), intraperitoneally, subcutaneously, intramuscularly (IM) or topically.

For oral administration, the pharmaceutical composition may be in the form of, for example, a tablet, hard or soft capsule, lozenges, dispensable powders, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are tablets or capsules.

The active ingredient may also be administered by injection (IV, IM, subcutaneous or jet) as a composition wherein, for example, saline, dextrose, or water may be used as a suitable carrier. The pH of the composition may be adjusted, if necessary, with suitable acid, base, or buffer. Suitable bulking, dispersing, wetting or suspending agents, including mannitol and PEG 400, may also be included in the composition. A suitable parenteral composition can also include a compound formulated as a sterile solid substance, including lyophilized powder, in injection vials. Aqueous solution can be added to dissolve the compound prior to injection.

The amount of therapeutically active compounds that are administered and the dosage regimen for treating a disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical condition of the subject, the severity of the inflammation or inflammation related disorder, the route and frequency of administration, and the particular compound employed, and thus may vary widely. The prodrug compositions should include similar dosages as for the parent compounds. The pharmaceutical compositions may contain

active ingredients in the range of about 0.1 to 1000 mg, preferably in the range of about 0.5 to 250 mg and most preferably between about 1 and 60 mg. A daily dose of about 0.01 to 100 mg/kg body weight, preferably between
5 about 0.05 and about 20 mg/kg body weight and most preferably between about 0.1 to 10 mg/kg body weight, may be appropriate. The daily dose can be administered in one to four doses per day.

In the case of skin conditions, it may be
10 preferable to apply a topical preparation of compounds of this invention to the affected area two to four times a day.

For disorders of the eye or other external tissues, e.g., mouth and skin, the formulations are preferably
15 applied as a topical gel, spray, ointment or cream, or as a suppository, containing the active ingredients in a total amount of, for example, 0.075 to 30% w/w, preferably 0.2 to 20% w/w and most preferably 0.4 to 15% w/w. When formulated in an ointment, the active
20 ingredients may be employed with either paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example at least 30% w/w of
25 a polyhydric alcohol such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol, polyethylene glycol and mixtures thereof. The topical formulation may desirably include a compound which enhances absorption or penetration of the active ingredient
30 through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogs. The compounds of this invention can also be administered by a transdermal device. Preferably topical administration will be
35 accomplished using a patch either of the reservoir and porous membrane type or of a solid matrix variety. In either case, the active agent is delivered continuously

from the reservoir or microcapsules through a membrane into the active agent permeable adhesive, which is in contact with the skin or mucosa of the recipient. If the active agent is absorbed through the skin, a controlled and predetermined flow of the active agent is administered to the recipient. In the case of microcapsules, the encapsulating agent may also function as the membrane. The transdermal patch may include the compound in a suitable solvent system with an adhesive system, such as an acrylic emulsion, and a polyester patch.

The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an emulsifier, it may comprise a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make-up the so-called emulsifying wax, and the wax together with the oil and fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations. Emulsifiers and emulsion stabilizers suitable for use in the formulation of the present invention include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol, glyceryl monostearate, and sodium lauryl sulfate, among others.

The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties, since the solubility of the active compound in most oils likely to be used in pharmaceutical emulsion formulations is very low. Thus, the cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or

branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters may be used. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils can be used.

Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredients are dissolved or suspended in suitable carrier, especially an aqueous solvent for the active ingredients. The antiinflammatory active ingredients are preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10% and particularly about 1.5% w/w.

For therapeutic purposes, the active compounds of this combination invention are ordinarily combined with one or more adjuvants appropriate to the indicated route of administration. If administered *per os*, the compounds may be admixed with lactose, sucrose, starch powder, cellulose esters of alkanolic acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulfuric acids, gelatin, acacia gum, sodium alginate, polyvinylpyrrolidone, and/or polyvinyl alcohol, and then tableted or encapsulated for convenient administration. Such capsules or tablets may contain a controlled-release formulation as may be provided in a dispersion of active compound in hydroxypropylmethyl cellulose. Formulations for parenteral administration may be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions and suspensions may be prepared from sterile powders or granules having one or

more of the carriers or diluents mentioned for use in the formulations for oral administration. The compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, 5 peanut oil, sesame oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art.
